

AI Magician Playbook

A compact field guide for using AI like a stage illusionist: frame the trick, control attention, prepare the assistant, and turn rough ideas into useful output.

Price: \$1 test product	Format: instant PDF download	Use: prompts, offers, drafts
--------------------------------	-------------------------------------	-------------------------------------

1. The Trick

AI feels magical when the operator controls the frame. Do not ask for a miracle. Define the audience, the desired output, the constraints, and the exact next action. The trick is not the model. The trick is the setup.

2. The Four-Part Spell

Use this structure: Context, Role, Output, Standard. Context tells the model what world it is in. Role tells it what kind of judgment to apply. Output tells it what to produce. Standard tells it how good the answer must be.

3. Misdirection

Remove distractions before asking. Give the model only the facts it needs. Long vague prompts create long vague answers. Short precise prompts create controllable output.

4. Reveal

Always end with something visible: a page, a checklist, a sales message, a table, a file, a diagram, or a decision. AI work should leave an artifact behind.

5. Revenue Prompt

Use AI to move from asset to offer to checkout. Ask: what can be sold, who already pays for this, what is the smallest package, what price makes sense, and what action gets one buyer today.

Copyable Prompt Patterns

Turn this rough idea into a one-page offer with buyer, pain, promise, price, proof, objections, and checkout CTA.

Review this webpage as a buyer. Tell me the fastest change that would make someone more likely to pay today.

Convert this document into five sellable digital products with title, price, buyer, promise, and fulfillment notes.

Act as a strict editor. Rewrite this prompt so the output is specific, testable, and immediately usable.

The Magician's Checklist

Frame	Who is this for, and what do they need?
Prop	What raw material does the AI receive?
Method	What structure should the output follow?
Reveal	What artifact appears at the end?
Test	What would prove this was useful?
